

## MT2015-29 : Myeloablative Allogeneic Hematopoietic Cell Transplantation Using a Related or Adult Unrelated Donor for the Treatment of Hematological Disorders

**Status:** Recruiting

### Eligibility Criteria

### Conditions & Interventions

**Keywords:**

Clinics and Surgery Center (CSC)

### More Information

**Description:** The primary research element is to determine whether a graft-versus-host disease (GVHD) prophylaxis regimen of post-transplant cyclophosphamide, tacrolimus and MMF will reduce the likelihood of chronic GVHD in patients receiving a standard hematopoietic myeloablative stem cell transplant. The treatment related components of this protocol are established clinical practices and are considered non-investigational. The primary endpoint is cumulative incidence of chronic GVHD requiring systemic immunosuppressive treatment at 1 year post-transplant.
