

Long-term toxicities and quality of life of cancer survivors treated with immunotherapy

Status: Recruiting

Eligibility Criteria

Age: 18 years and over

This study is NOT accepting healthy

Healthy Volunteers: volunteers

Inclusion Criteria:

Individuals diagnosed with cancer and treated with immunotherapies within the MHealth Fairview system

Conditions & Interventions

Conditions:

Cancer

Keywords:

Clinics and Surgery Center (CSC), immunotherapy

More Information

Description: Immunotherapies, such as immune checkpoint inhibitors, have greatly improved survival for many cancers and are now approved for over half of all cancer patients. However, many patients receiving immunotherapy experience Grade 3 and 4 toxicities, termed immune-related adverse events (IRAEs) which cause frequent hospitalizations, emergency department visits, impaired health-related quality of life (QOL) and often discontinuation of therapy. While clinical trials of immunotherapeutic drugs have reported on IRAEs over short time-periods, the real-life and long-term frequencies of and experiences with IRAEs outside of clinical trials, and the general experience of taking immunotherapies long-term remain unknown. The goal of this protocol is to build a prospective cohort study of cancer survivors who receive immunotherapies.
