

A Randomized, Comparative Effectiveness Study of Staged Complete Revascularization with Percutaneous Coronary Intervention to Treat Coronary Artery Disease vs Medical Management Alone in Patients with Symptomatic Aortic Valve Stenosis undergoing Elective Transfemoral Transcatheter Aortic Valve Replacement: The COMPLETE TAVR Study

Status: Recruiting

Eligibility Criteria

Age: 18 years and over

This study is NOT accepting healthy

Healthy Volunteers: volunteers

Inclusion Criteria:

- at least 18 years old - diagnosis of severe symptomatic aortic valve stenosis and coronary artery disease - successful transfemoral transcatheter aortic valve replacement (TAVR) defined as the implantation of a single transcatheter aortic valve within the past 96 hours

Exclusion Criteria:

- percutaneous coronary intervention (PCI) already completed less than 90 days before TAVR - planned PCI or cardiac surgery - additional significant heart or medical diagnosis (study team will review)

Conditions & Interventions

Conditions:

Heart & Vascular

Keywords:

Clinics and Surgery Center (CSC), Aortic Stenosis, Coronary Artery Disease, TAVR, transfemoral transcatheter aortic valve replacement

More Information

Description: The study will be a randomized, multicenter, open-label trial with blinded adjudication of outcomes.
